Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 42.183; Variance 238.791; scale 0.177

Pri New isolated Down's Syndrome-cell adhesion molecule - used to pri develop products for detection, diagnosis and therapy of pri develop products for detection, diagnosis and therapy of pri develop products for detection, diagnosis and therapy of private polypeptide comprises Down Syndrome-cell adhesion'holecule CC This polypeptide comprises Down Syndrome-cell adhesion'holecule CC ScAMI, a cell surface glycoprotein belonging to a novel subclass of the Ig superfamily with highest homology to neural cell adhesion CC of the Ig superfamily with highest homology to neural cell adhesion CC splice variant, DS-CAM2 (see W42087), which is non-membrane bound CC splice variant, DS-CAM2 (see W42087), which is non-membrane bound CC splice variant, DS-CAM2 (see W42087), which is non-membrane bound CC of the Ig state of the invention also provides human and murine CC of the Ig state of the state of the state of the state of the coronic cells, transgenic animals, antibodies, antisense CC oligonucleotides, and primers derived from DS-CAM nucleic acid. CC of the Ig state of the state of the state of the coronic cells of the state of the state of the coronic cells of the state of the coronic cells of the state of the coronic cells of the cells of the coronic cells of the

Scoring table: PAM 150 Gap 11

Searched: 142080 segs, 47172406 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: pir62 1:pir1 2:pir2 3:pir3 4:pir4

Statistics: Mean 57.841; Variance 116.313; scale 0.497

pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Tue Apr 25 12:34:34 2000; MasPar time 57.44 Seconds 993.145 Million cell updates/sec

Tabular output not generated.

Description: Perfect Score:

Sequence: >US-08-956-991-2 (1-1910) from US08956991A.pep 13516 1 MWILALSLFQSFANVFSEDL......ANIGQVTSYICLHTLEWTFC 1910

Scoring table: PAM 150 Gap 11

Searched: 82229 segs, 29864866 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: swiss-prot38 1:swissprot

Statistics: Mean 58.721; Variance 101.190; scale 0.580

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Statistics: Mean 57.116; Variance 101.329; scale 0.564

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

No. is the number of results predicted by chance \infty have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score

reural cell adhesion molecules. A modified direct cDNA selection technique was applied to bacterial and P1 artificial chromosomes between ETS2 and MX1 by using cDNA from trisomy 21 human foetal between ETS2 and MX1 by using cDNA from trisomy 21 human foetal obtained and used to screen a trisomy 21 human foetal brain (14-wk obtained and used to screen a trisomy 21 human foetal brain (14-wk opestation) cDNA library. Further clones were obtained by exon trapping, and the complete DS-CAM2 CDNA sequence was identified. Trapping, and the complete DS-CAM2 CDNA sequence was identified. CDS-CAM2 is a splice variant of membrane-bound DS-CAM1 (see W42086) and is deleted for the entire transmembrane domain. The DS-CAM gene spans 900-1200 kb of genomic DNA and maps at chromosome 21a(22.2-22.3. The invention also provides murine DS-CAM partial cransgenic animals, antisense oligonucleotides, and primers useful transgenic animals, antisense oligonucleotides, and primers useful cransgenic fication of DS-CAM nucleic acid. DS-CAM polypeptides are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      associated with developmental and neurological processes. They can be used in e.g. neural prosthetic devices used in entubulation methods of repairing (regenerating) damaged or severed peripheral nerves. The products can also be used in detection, diagnosis and therapy of developmental and neurological abnormalities such as pown syndrome, mental retardation, holoprosencephaly, agenesis of the corpus callosum, or schizencephaly. Antisense oligonucleotides are used for inhibiting translation of mRNA. 1707 G: 1292 T; sequence 6413 BP; 1633 A: 1781 C:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This cDNA clone codes for Down syndrome-cell adhesion molecule DS-CAM2 (see W42087), an extracellular, soluble protein belonging to a novel subclass of the Ig superfamily with highest homology to a novel subclass of the Ig superfamily with highest homology.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     P-PSDB; W42087

Claim 3; Page 65-72; 109pp; English,
CC This CDNA clone codes for Down syndrome-cell adhesion molecule
CC DS-CAM1 (see W42085), a cell surface glycoprotein belonging to a
CC DS-CAM1 (see W42085), a cell surface glycoprotein belonging to a
CC convel subclass of the Ig superfamily with highest homology to
CC neural cell adhesion molecules. A modified direct cDNA selection
CC technique was applied to bacterial and Pl artificial chromosomes
CC between ETS2 and MX1 by using CDNA from trisomy 21 human foetal
CC brain. A unique cDNA fragment, designated E51 (see V31982), was
CC obtained and used to screen a trisomy 21 human foetal brain (14-wk
CC gestation) cDNA library. Further clones were obtained by exon
CC trapping. The complete DS-CAM1 cDNA sequence was deduced from
CC overlapping clones. A splice variant CDNA (see V31988), encoding
CC overlapping clones. A splice variant CDNA (see V31988), encoding
CC overlapping spans 900-1200 kb of genomic DNA and maps at chromosome
CC 1922,2-22.3. The invention also provides murine DS-CAM partial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RESULT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  21q22.2-22.3. The invention also provides murine DS-CAM partial sequences (see V31985-87), expression vectors and host cells, sequences (animals, antisense oligonucleotides, and primers useful for amplification of DS-CAM nucleic acid. DS-CAM polypeptides are associated with developmental and neurological processes. They can be used in e.g. neural prosthetic devices used in entubulation methods of repairing (regenerating) damaged or severed peripheral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             nerves. The products can also be used in detection, diagnosis a therapy of developmental and neurological abnormalities such as pown syndrome, mental retardation, holoprosencephaly, agenesis of the corpus callosum, or schizencephaly. Antisense oligonucleotiare used for inhibiting translation of mRNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              4877 CCAGTTCTCAAAGGAGCAGG 4896
             New isolated Down's Syndrome-cell adhesion molecule used to develop products for detection, diagnosis and therapy of developmental and neurological abnormalities claim 2; page 81-83; 109pp; English.

This CDNA sequence comprises the 3' region of a cDNA clone for murine Down syndrome-cell adhesion molecule (DS-CAM), a member of a novel subclass of the Ig superfamily with homology neural cell adhesion molecules. The middle region (see V31965)
                                                                                                                                                                                                                                                                                                                                              Mouse Down syndrome-cell adhesion molecule DS-CAM 3/DS-CAM; Down syndrome-cell adhesion molecule; neural signal transduction; trisomy 21; mental retardation; holoprosencephaly; corpus callosum agenesis; schizencephaly; diagnosis; assay; mouse; ds; Ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          V31987 standard; CDNA; 217

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 nucleic search, using sw model

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

PFT New isolated Down's Syndrome-cell adhesion molecule - used to develop products for detection, diagnosis and therapy of products for developmental and neurological abnormalities.

EXample 2; Page 79; 109pp; English.

CC This polynucleotide comprises cDNA fragment E51 that was isolated converted to the converted direct cDNA selection technique applied to bacterial and P1 artificial chromosomes between ETS2 and MX1. E51 was used as a probe to screen the trisomy 21 foetal converted to brain library. 62 Clones were isolated from the 2 million clones converted to deduce a full-length sequence (see V31981) coding for novel Down syndrome-cell adhesion molecule D5-CAM1 (see M2086). A splice variant, D3-CAM2 (see V31918), was also identified. D5-CAM polypeptides are associated with developmental converted to develop processes. The polypeptides and nucleic acids therapy of developmental and neurological abnormalities.

              New isolated Down's Syndrome-cell adhesion molecule - used to develop products for detection, diagnosis and therapy of developmental and neurological abnormalities claim 3; Page 65-72; 109pp; English.

This cDNA clone codes for Down syndrome-cell adhesion molecule DS-CAM1 (see W42086), a cell surface glycoprotein belonging to a novel subclass of the Ig superfamily with highest homology to neural cell adhesion molecules. A modified direct cDNA selection technique was applied to bacterial and Pl artificial chromosomes
                                                                                                                                                                                                                                                                                                                                                                                                               Key

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  brain. A unique cDNA fragment, designated E51 (see V31982), was obtained and used to screen a trisony 21 human foetal brain (14-wk gestation) cDNA library. Further clones were obtained by exon trapping. The complete DS-CAM1 cDNA sequence was deduced from overlapping clones. A splice variant cDNA (see V31988), encoding non-membrane bound DS-CAM2 (see W42087), was also identified. The DS-CAM gene spans 900-1200 kb of genomic DNA and maps at chromosome 21q22.2-22.3. The invention also pivvides murine DS-CAM partial sequences (see V31985-87), expression vectors and host cells. Transgenic animals, antisense oligonucleotides, and primers useful for amplification of DS-CAM nucleic acid. DS-CAM polypeptides are associated with developmental and neurological processes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      associated with developmental and neurological processes. They can be used in e.g. neural prosthetic devices used in entubulation methods of repairing (regenerating) damaged or severed peripheral nerves. The products can also be used in detection, diagnosis and therapy of developmental and neurological abnormalities such as pown syndrome, mental retardation, holoprosencephaly, agenesis of the corpus callosum, or schizencephaly. Antisense oligonucleotides are used for inhibiting translation of mRNA.

Sequence 6604 BP; 1673 A; 1827 C; 1768 G; 1336 T;
                     21q22.2-22.3. The invention also provides murine DS-CAM partial sequences (see v31985-87), expression vectors and host cells,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       23-OCT-1997; U19547.

                                             The sequence contained an oligo-dT track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NotI site and the oligo-dT track served to verify it as a clone from the non-normalized prefrontal cortex library cDNA Library Preparation: M.B. Soares Lab Clone distribution: NIH BMAP cDNA clones will be made available by the means that is soon to be determined. When NIH determines the means for distribution of the BMAP cDNA clones, this record will be updated accordingly when that means is determined. Seq primer: M13 Forward

                                                                                                                                                                                                                                                                                                                                                                                                                Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PT New isolated Down's Syndrome-cell adhesion molecule - used to PT develop products for detection, diagnosis and therapy of PT developmental and neurological abnormalities

PS Claim 3; Page 83-90; 109pp; English.

CC DS-CAM2 (see W42087), an extracellular, soluble protein belonging CC DS-CAM2 (see W42087), an extracellular, soluble protein belonging CC DS-CAM2 (see W42087), an extracellular, soluble protein belonging CC DS-CAM2 (see W42087), an extracellular, soluble protein belonging CC to an ovel subclass of the Ig superfamily with highest homology to CC centique was applied to bacterial and PI artificial chromosomes CC between ETS2 and MX1 by using cDNA from trisomy 21 human foetal brain (14-wk CC destation) cDNA library. Further clones were obtained by exon CC trapping, and the complete DS-CAM2 CDNA sequence was identified.

CC DS-CAM2 is a splice variant of membrane-bound DS-CAM1 (see W42086) CC dend is deleted for the entire transmembrane domain. The DS-CAM CC dend is deleted for the entire transmembrane domain. The DS-CAM CC dend is deleted for the entire transmembrane domain. The DS-CAM CC dend is deleted for the entire transmembrane domain. The DS-CAM CC dend is deleted for the entire devices murine DS-CAM partial CC transgenic animals, antisense oligonucleotides, and primers useful for amplification of DS-CAM nucleic acid. DS-CAM polypeptides are associated with developmental and neurological processes. They can be used in e.g. neural prosthetic devices used in entubulation completes. The products can also be used in entubulation diagnosis and complete complete developmental and neurological abnormalities such as complete developmental
                                                                                                                                                                                                                                                         δÃ

  pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                             307.6
